

Seven stages, left to right

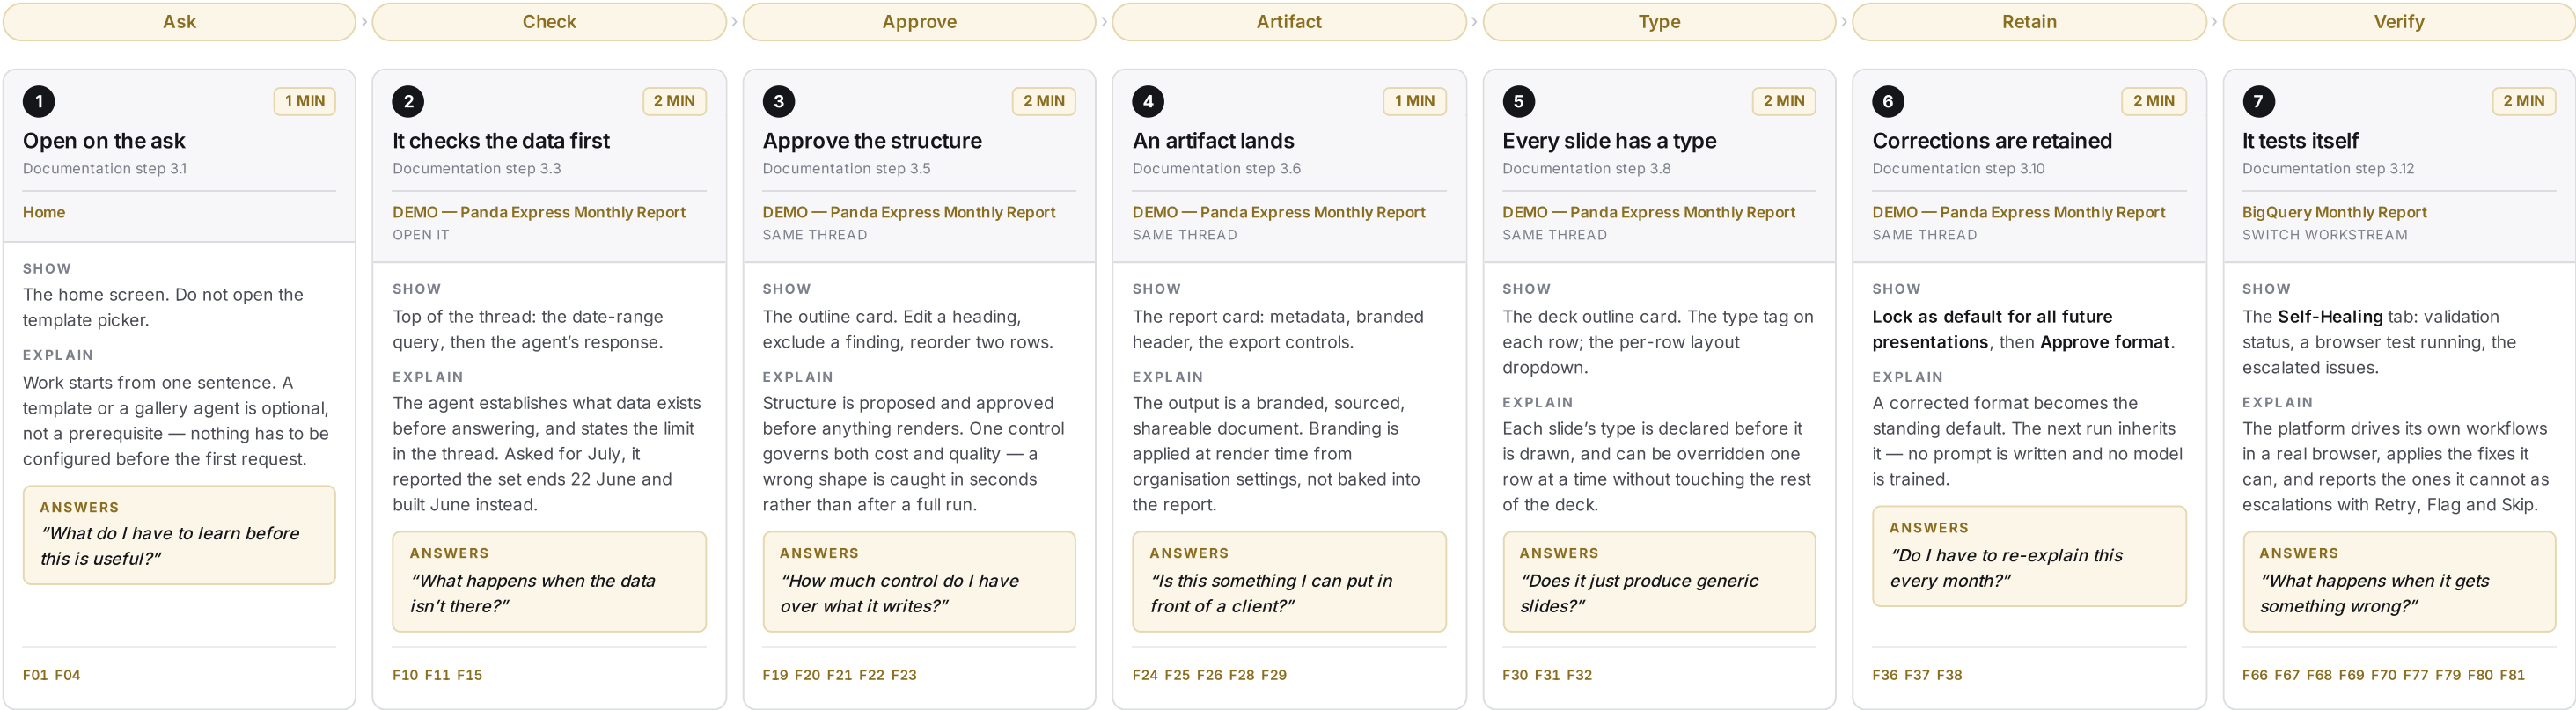

Each stage is one screen, the point it makes, and the question it answers. Stage numbers map to the demo path in the product documentation.

Two workstreams. Stages 2–6 run in **DEMO — Panda Express Monthly Report** — one thread, scrolled through in order. Stage 7 moves to **BigQuery Monthly Report → Self-Healing**. Stage 1 is Home, before either.

THE ARC

BEFORE YOU START

Four things that break the run.

- Sign in before you start

The session expires after roughly an hour idle.
- Leave both outline cards unapproved

Stages 3 and 5 depend on them. Approving removes the card.
- Confirm the deck is Landscape

Orientation persists between sessions; only a reload reverts it.
- Stay out of Organization → Errors

It lists open reports org-wide. The Self-Healing tab covers the same ground in context.

IF THEY ASK

The four questions that come up, and the honest answer.

- Can it reach our internal systems?

api_connector_tool makes approved external HTTP calls and is in the library. It is configured on zero workstreams today. F90
- Who can see my work?

A conversation is private to the people granted access. Separately, the workstream template is organisation-wide by default. F57
- What does it cost?

Metered per workstream. The reference workstream: 6.8M tokens over 25 sessions, \$21.97 estimated, broken down by model. F87
- Which model is it using?

Chosen per workstream before anything is spent, limited to the four models the organisation has approved. An unapproved model is refused, not substituted. F86
